For more than 20 years, the physicians and healthcare providers at Riverhills Neuroscience have recognized the clinical role of behavioral, psychological, sociological, and environmental factors in overall health.

Neuropsychological Evaluations

At Riverhills Neuroscience, our behavioral specialists perform comprehensive neuropsychological evaluations to assist in accurate medical diagnoses. Objective neuropsychological assessment also guides treatment planning for conditions that may be associated with diminished memory and cognitive ability — such as traumatic brain injury, dementia, stroke, or multiple sclerosis.

Neuropsychological evaluation can be used to track progress after a neurological injury or disease. It can also help guide decisions about rehabilitation, returning to work, or living independently.

Psychotherapy

Our behavioral medicine specialists also provide psychotherapy to help patients manage chronic conditions, such as chronic pain, multiple sclerosis, or Parkinson’s disease. With proper coping skills, a patient’s recovery from or management of illness is greatly improved. We are also able to assess psychological and environmental aspects of medical illness to aid physicians in medical treatment planning, to improve patient’s overall health, and maximize functioning.

Commonly Treated Conditions:

- Traumatic brain injury
- Neurological conditions, including stroke, epilepsy, brain tumors, multiple sclerosis (MS), Alzheimer’s disease, and Parkinson’s disease.
- Medical conditions such as liver disease, Lupus, HIV infection, or cardiac disease
- Suspected memory problems or dementia
